SKILL WALLET PROJECT REPORT

FineBuddy

Personal Finance Advisor Bot

Python and Streamlit Based Web Application

Submitted for: Skill Wallet Project Submission

Student Name: _____

Branch: Artificial Intelligence and Data Science (AIDS)

Year: Second Year B.Tech

College: Dr. D. Y. Patil College of Engineering and Innovation, Varale

ABSTRACT

FineBuddy is a personal finance advisor bot designed to help users manage everyday money matters through a simple web application. It brings together tools for budgeting, savings goals, EMI calculation, and general loan guidance. Users can enter basic financial details and receive clear calculations and suggestions that may help them plan their monthly spending.

The application is developed using Python and Streamlit. Its key features include a user profile, Budget Maker, Savings Goal Tracker, EMI Calculator, Loan Recommendation System, Chat Memory, and a Money Health Score. English, Hindi, and Marathi language options are included to make the interface easier to understand for more users. FineBuddy is intended for learning and planning; it does not approve loans or replace professional financial advice.

CHAPTER 1 – INTRODUCTION

1.1 Background

Managing personal finances involves understanding income, expenses, savings, and borrowing. People may find it difficult to keep track of monthly spending, decide how much to save, or estimate whether a loan instalment fits their budget. Using separate tools for each task can also be inconvenient, especially for beginners.

FineBuddy aims to make these tasks simpler by placing common financial planning tools in one application. The user enters the required details, selects a feature, and views the result in a clear format.

1.2 Problem Statement

Many users need a beginner-friendly platform that combines monthly budget planning, savings tracking, EMI estimates, and basic loan guidance. Without a clear overview of income and expenses, it may be difficult to plan savings or understand the monthly commitment of a loan. FineBuddy addresses this need through a simple, accessible interface.

1.3 Objectives

- Develop a simple web-based personal finance assistant.
- Help users compare monthly income with expenses.
- Support savings target planning and progress tracking.
- Calculate estimated monthly loan instalments (EMIs).
- Provide general loan guidance based on user-entered details.
- Show a Money Health Score based on basic financial indicators.
- Support English, Hindi, and Marathi for accessible interaction.

1.4 Scope

FineBuddy is intended for personal budgeting and financial awareness. It can help users explore spending, savings, and estimated loan repayments. It does not connect to bank accounts, access official credit records, guarantee loan eligibility, or make lending decisions. The quality of its outputs depends on the information entered and the logic implemented in the application.

CHAPTER 2 – SYSTEM STUDY AND DESIGN

2.1 Existing System

People may use notebooks, spreadsheets, or separate online calculators to manage money. These methods can be useful, but information remains scattered across different tools. Some platforms may also use complicated terminology or provide limited language options.

2.2 Proposed System

FineBuddy combines key financial planning features in a single Streamlit application. Users can enter profile details, review their budget, set savings goals, calculate an EMI, and receive general loan-related guidance. The application is designed to present results in a straightforward way.

2.3 System Architecture

The system follows an input–processing–output structure:

• **Input layer:** collects details such as monthly income, expenses, savings target, loan amount, interest rate, and tenure when required.
• **Processing layer:** Python code validates inputs and performs the relevant calculations or recommendation logic.
• **Output layer:** Streamlit displays results, progress information, and guidance in the selected supported language.

User → Streamlit Interface → Python Processing → Result / Guidance

2.4 Main Modules

• **User Profile:** uses basic details entered by the user, such as income, expenses, age, city, and financial goals.
• **Budget Maker:** helps the user understand the amount remaining after monthly expenses.
• **Savings Goal Tracker:** tracks a target amount and target period and shows progress.
• **EMI Calculator:** estimates a monthly instalment from loan amount, interest rate, and repayment period.
• **Loan Recommendation System:** provides general guidance for categories such as bike, phone, house, education, or personal loans.
• **Chat Memory:** maintains relevant conversation state where supported by the application.
• **Money Health Score:** provides a project-specific score from 0 to 100; it is not an official credit score.
• **Language Support:** offers English, Hindi, and Marathi for translated portions of the interface.

CHAPTER 3 – IMPLEMENTATION

3.1 Technologies Used

• **Python:** handles calculations, input processing, and application logic.
• **Streamlit:** creates the interactive web interface using Python.
• **Code editor:** Visual Studio Code or another editor can be used to write and maintain the source code.
• **GitHub:** stores the project code and report and supports version management.
• **Hosting:** Streamlit Community Cloud or similar hosting may be used to publish a browser-accessible demonstration.

3.2 Working of the Application

1. The user opens FineBuddy in a web browser.
2. The user chooses a supported language and enters the required details.
3. The user selects budgeting, savings tracking, EMI calculation, or loan guidance.
4. The application processes the inputs using Python logic.
5. FineBuddy displays the calculated result and general guidance.
6. The user can change the values and review updated results.

3.3 Basic Calculation Logic

Monthly balance is calculated by subtracting monthly expenses from monthly income:

Monthly Balance = Monthly Income – Monthly Expenses

For a standard fixed-rate loan, EMI is estimated using the following formula:

EMI = P × r × (1 + r)■ ÷ ((1 + r)■ – 1)

Here, P is the loan principal, r is the monthly interest rate expressed as a decimal, and n is the total number of monthly instalments. The estimate may not include processing fees, insurance, or other lender charges.

3.4 Responsible Use

FineBuddy provides educational estimates rather than official financial decisions. Users should enter only information needed for a feature and should never provide bank passwords, PINs, or one-time passwords. Important loan decisions should be checked with an authorised lender or qualified professional.

CHAPTER 4 – TESTING, CONCLUSION AND FUTURE SCOPE

4.1 Testing

The application should be checked with normal and invalid inputs to confirm that each feature works correctly. These are suggested test cases; update the status after testing the submitted version.

Test Case	Expected Result	Status
Budget tool	Shows income minus expenses	To verify
Savings tracker	Shows progress toward target	To verify
EMI calculator	Shows estimated monthly EMI	To verify
Invalid loan input	Prevents or flags invalid values	To verify
Language selector	Updates supported labels and responses	To verify
Money Health Score	Shows score within intended 0–100 range	To verify

4.2 Conclusion

FineBuddy is a beginner-friendly personal finance assistant that brings budgeting, savings tracking, EMI estimation, loan guidance, and a Money Health Score into one web application. Python supports the calculation logic, while Streamlit provides the interactive interface. Language options for English, Hindi, and Marathi aim to make the application more accessible. The project demonstrates how software can be applied to an everyday financial planning problem.

4.3 Limitations

- Results depend on the accuracy of user inputs.
- EMI estimates may exclude lender-specific fees and charges.
- Loan guidance does not mean loan approval or official eligibility.
- The Money Health Score is not a bank or credit-bureau score.

4.4 Future Scope

- Add charts for income, expenses, and savings trends.
- Provide downloadable monthly budget reports.
- Improve automated testing and input validation.
- Add optional reminders for savings goals and payments.
- Improve language coverage, accessibility, and secure data handling.
